Contents

1 Introduction
  1.1 Lie Symmetry Analysis for Scalar Second Order ODEs .................................. 9
    1.1.1 Point Transformations and Infinitesimal Generators ............................... 10
    1.1.2 Extended Transformations and Prolongations of Symmetry Generators .......... 12
    1.1.3 Lie Point Symmetry Conditions .......................................................... 15
    1.1.4 Multiple Parameter Lie Groups and Lie Algebras .................................. 15
    1.1.5 Integration of Second Order ODEs ....................................................... 17
    1.1.6 Invariants of Algebraic and Differential Equations ................................. 18
    1.1.7 Equivalence Classes of Scalar ODEs ................................................... 21
    1.1.8 Lie Linearization Theorem ..................................................................... 21
    1.1.9 Noether Symmetries and First Integrals ................................................ 23
    1.1.10 Lie Point Symmetry Group Classification in the Plane ............................ 24
  1.2 Lie Symmetry Analysis for Systems of Second Order ODEs .............................. 25
    1.2.1 Lie Point Symmetry Conditions for Systems .......................................... 26
    1.2.2 Symmetry Structure of Linearizable Two Dimensional Systems of Second Or-
        der ODEs ................................................................................................. 29
    1.2.3 Noether Symmetries and First Integrals for Systems ............................... 30
  1.3 Geometric Linearization ................................................................................. 31
  1.4 Systems Obtainable from Complex ODEs and PDEs ....................................... 35
  1.5 Complex-Linearization .................................................................................. 36

2 Inequivalent Geometric and Complex-Linearizable Two Dimensional Systems of
   Second Order ODEs ......................................................................................... 39
  2.1 Inequivalence of Two Classes of Linearizable Systems under Constant Linear Tran-
      formations .................................................................................................... 40
  2.2 Inequivalence of Two Classes of Linearizable Systems under Linear Point Transfor-
      mations with Variable Coefficients ................................................................ 42
2.3 Inequivalence of Two Classes of Linearizable Systems under Arbitrary Point Transformations ........................................ 43

3 Linearizable Two Dimensional CR-Structured Systems of ODEs 45
3.1 Conditions for the Correspondence of Systems and Base Scalar ODEs .......... 46
3.2 Reduced Optimal Canonical Form of Linear CR-Structured Systems ............ 47
3.3 Symmetry Structure of Linearizable Two Dimensional Systems of Second Order ODEs 49
3.4 Applications ........................................ 53

4 Symmetry Solutions of Two Dimensional Systems Not Solvable by Symmetry Analysis 57
4.1 Classification ........................................ 58
4.2 Role of the CR-Equations for Systems of Two Second Order ODEs ............ 58
4.3 $\Upsilon_1$−class: Complex-Integrable Systems .................................. 60
4.4 $\Upsilon_2$−class: Linearizable Systems (Revisited) .................................. 62
4.5 $\Upsilon_3$−class: Complex-Linearizable Systems .................................. 63
4.5.1 Solvable Systems with 4-Dimensional Algebra ................................. 64
4.5.2 Solvable Systems with 3-Dimensional Algebra ................................. 65
4.5.3 Solvable Systems with 2-Dimensional Algebra ................................. 66
4.5.4 Solvable Systems with 1-Dimensional Algebra ................................. 67
4.5.5 Coupled-Modified-Emden System (Revisited) .................................. 67

5 Lie-Like Operators and Lie Point Symmetries for Two Dimensional Systems 69
5.1 Lie-Like Conditions for Systems ........................................ 70
5.2 Most General Forms of Systems that Admit Lie-Like Operators .................... 72
5.3 Comparison of the Lie-Like Operators and Lie Point Symmetries for Systems .... 74
5.4 Examples ........................................ 79
5.5 Noether-Like Operators, Noether Symmetries and Associated First Integrals .... 81
5.6 First Integrals Associated with the Complex-Linearizable Systems ............... 82

6 Linearization of Systems of Four Second Order ODEs 88
6.1 Canonical Forms for Systems of Four Second Order ODEs ....................... 89
6.2 Complex-Linearization Criteria for Systems of Four Second Order ODEs ........ 90
6.3 Computer Algorithm ........................................ 92
6.4 Applications ........................................ 92

7 Ibragimov-Type Invariants for a System of Two Linear Parabolic Equations 97
7.1 Parabolic Type Systems and Associated Equivalence Transformations ........... 98
7.2 Semi-Invariants under Transformation of the Dependent Variables ................ 100
7.2.1 Uncoupled Parabolic Type Systems ............................................. 102
7.2.2 Coupled Parabolic Type Systems ................................................. 103
7.3 Applications .................................................................................... 104

8 Conclusions ...................................................................................... 107

9 Appendix ........................................................................................... 117
  9.1 Appendix A-1 .................................................................................. 117
  9.2 Appendix A-2 .................................................................................. 118

Bibliography ....................................................................................... 121
