

CONTENTS

Title	Page No.
Introduction	1
Review of literature	11
2.1 Decolorization of dye by white-rot fungi	11
2.2 Enzymes of white rot fungi involved in decolorization	13
2.2.1. Effect of pH on the rate of color removal	15
2.2.2. Effect of temperature on the rate of color removal	16
2.2.3. Effect of carbon additives on the rate of color removal	17
2.2.4. Effect of nitrogen additives on the rate of color removal	17
2.2.5. Effect of metal ions on the rate of color removal	19
2.2.6. Effect of redox mediator on the rate of color removal	21
2.2.7. Effect of dye concentration on the rate of color removal	23
2.3. Purification, characterization and kinetics studies of enzyme produced during dye decolorization	24
2.4. Detoxification of metabolites produced during the dye decolorization	25
2.5. Application of white rot fungi and their ligninolytic enzymes	26
Materials & Methods	30
3.1 Chemicals	30
3.2. Dyes and effluents collection	30
3.3. Fungal culture and sporulation media	31
3.4. Inoculum preparation	32
3.5. Dyestuff analysis	33
3.6. Enzyme system of white-rot fungus	33
3.6.1. Laccase activity	33
3.6.2. Manganese peroxidase (MnP)	34
3.6.3. Lignin peroxidase (LiP)	34
3.7. Initial time course study for the screening of dye and fungus	35
3.8. Processes optimization for efficient decolorization and enzymes production	35
3.8.1. Selection of basal nutrient media	36
3.8.2. Effect of initial pH	36

3.8.3. Effect of incubation temperature	37
3.8.4. Effect of inoculum size	38
3.8.5. Effect of carbon supplements	38
3.8.6. Addition of different concentration of pre-optimized carbon source	39
3.8.7. Effect of nitrogen additives	40
3.8.8. Effect of different concentration of pre-optimized nitrogen additive	41
3.8.9. Effect of surfactant	42
3.9. Effect of metal ions	43
3.10. Effect of redox mediator on the rate of color removal by <i>Agaricus</i> species	44
3.11. Effect of initial dye concentration	45
3.12. Determination of final pH & dry cell weight	46
3.13 Purification of enzyme	47
3.14 Protein estimation	47
3.15 Characterization of enzyme	47
3.15.1. Optimum pH	47
3.15.2. Optimum temperature	48
3.15.3. Activation energy	48
3.15.4. Substrate effect on enzyme activities	48
3.15.5. Thermodynamics studies	48
3.16. Determination of BOD and COD	49
3.16.1. Chemical oxygen demand (COD)	49
3.16.2. Biochemical oxygen demand (BOD)	49
3.17. Decolorization of malachite green dye by laccase/laccase mediator system	50
3.17.1. Dyes and Chemicals	50
3.17.2. Extraction of phenolic compounds from groundnut shells	50
3.17.3 Decolorization of malachite green dye by laccase/laccase mediator system	50
3.17.4. UV-Vis spectral analysis	50
3.17.5. HPLC analysis	51
3.17.6. Toxicity study	51
3.18. Statistical Analysis	51
Results & Discussion	52

4.1. Initial time course study for screening of Direct, Reactive dyes and white rot fungus	52
4.2. Optimization of various culture conditions to enhance the production of enzymes/ decolorization	60
4.2.1. Effect of media composition on the rate of color removal	61
4.2.2. Effect of pH on the rate of color removal	63
4.2.3. Effect of incubation temperature on the rate of color removal	67
4.2.4. Effect of inoculum level on the rate of color removal	71
4.2.5. Effect of carbon additive on the rate of color removal	75
4.2.6. Effect of carbon concentration on the rate of color removal	77
4.2.7. Effect of nitrogen additives on the rate of color removal	82
4.2.8. Effect of pre-optimized nitrogen additive concentration on the rate of color removal	84
4.2.9. Effect of surfactant on the rate of color removal	88
4.3. Effect of metal ions on the rate of color removal	93
4.3.1. Effect of different redox mediators on the rate of color removal	96
4.3.2. Effect of dyestuff concentration on the rate of color removal	98
4.4. Determination of final pH & dry cell weight	102
4.5. Purification of enzymes	102
4.5.1. Ammonium sulfate precipitation	102
4.5.2. Dialysis	102
4.5.3. Ion-exchange chromatography	103
4.5.4. Gel permeation chromatography (GPC)	104
4.5.5. Protein estimation	105
4.6. Characterization of enzyme	107
4.6.1. Optimum pH of lignin peroxidase (LiP)	107
4.6.2. Optimum pH of manganese peroxidase (MnP)	108
4.6.3. Optimum temperature of Lignin peroxidase (LiP)	109
4.6.4. Optimum temperature of manganese peroxidase (MnP)	110
4.6.5. Effect of substrate (V_{max} and K_m)	110
4.7. Thermodynamics of irreversible thermal denaturation	111
4.8. Application of <i>Agaricus</i> species in the decolorization of real dye-containing effluents	116

4.9. Initial time course study	117
4.9.1. Influence of pH on the Color Removal of Textile Effluent	120
4.9.2. Effect of carbon additive on the decolorization of real textile effluent	123
4.9.3. Optimization of best nitrogen additive for maximum color removal	125
4.10. Determination of final pH & dry cell weight	127
4.11. Determination of different pollution parameters	128
4.11.1. Chemical oxygen demand (COD)	128
4.11.2. Biological oxygen demand BOD	128
4.12.A CASE STUDY	129
4.12.1. Decolorization of MG by laccase in the presence of groundnut shell extract (GNE)	129
4.12.2. Transformation of malachite green dye by laccase mediator system	131
4.12.3. Microbial toxicity of malachite green and its degradation product	137
Summary	137
Literature cited	140
